The AutoCAD hacking community is small and easy to access. For more on AutoCAD, read here. What is AutoCAD? AutoCAD is the most popular, and arguably the best, desktop CAD/drafting software available. Developed by Autodesk, AutoCAD is often the CAD/drafting tool of choice for architects, engineers, construction professionals, and many others. AutoCAD is a 2D and 3D drafting program that offers powerful tools for creating and editing floor plans, architectural design drawings, technical schematics, floor plans, civil and mechanical designs, blueprints, drawings, and much more. The AutoCAD program lets you move, rotate, resize, and adjust the objects on your screen. You can use the selection tool to select objects, then move, copy, paste, or cut them. You can fill in the interior and exterior of shapes or insert objects into them. You can also create and insert unlimited layers of objects. You can draw lines, curves, arcs, and create beziers. You can draw rectangles, circles, polygons, and generate parametric and NURBS curves. AutoCAD is much more than a drafting program. It also includes a database and presentation package for viewing and storing data. It is possible to design models that are used for producing 3D images using a 3D modeling toolkit and OpenGL. AutoCAD has a range of settings that control the experience you have with the program. You can choose to automatically save documents, open documents in the background, make the program load faster, set your screen resolution, and a host of other options. In many cases, when you choose to adjust the settings of the program, the screen might become un

Hey all, I wanted to start a discussion on the difficulty in conveying the concept of 'periodic table style elements' to the lay person. Historically, the periodic table as we have grown to know and love has some very interesting features: Overlooked, 'alternate' nomenclature to help with memorization All elements in a table are chemically reactive, since the periodicity of all elements in the table is defined by number of protons. Elements which aren't found in the environment can be found in dust! In the 60s and 70s, the focus was on understanding the structure of the atom. By the time the discovery of the Higgs Boson was announced, the periodic table was already defined! In contrast to the historical table, the new table doesn't include a single element which is not naturally occurring. There are multiple named elements in the new table which have yet to be 'discovered'. If there were any possibility of the new table being named after a person, the suggestion would be James Chadwick. Instead the people behind this move will go back to working out the differences between their current table and the historical table. If you look at the periodic table, there are multiple sets of names. These names are all very important, for the set of names is what defines the category of element. This is a problem. Elements in the 'Alkali Metals' and 'Alkaline Earth Metals' group have the same name, 'period 7'. Neodymium, Europium and Terbium are 'lanthanoid' elements, which also have the same name! What is the basis of categorization? Science! In general, there are 3 ways to sort elements into sets: Defined by ionization energy Defined by number
