Demonstrates a wide variety of IFC functionalities and provides clear access to them. Every day, millions of IFC files are created and used by people all over the world. The source of the IFC format is the STEP 5.0 standard developed by the United States of America and Europe. The STEP specification was originally developed in the mid-1990s and has been revised several times. STEP, or Structure for Translation of Environment into Graphics, is a technology that was created with the goal of creating a method to exchange all kinds of CAD (Computer-Aided-Design) formats. In short, STEP is a format to exchange 3D object data between CAD programs. The 3D object data is stored in the IFC format, a tool that was developed by the United States of America. The IFC format is based on the STEP standard, but it has different versions based on the STEP specification. The IFC format was developed for the Windows platform, and therefore, it is a graphical format. The other fact that could be considered is that the other formats that were created with the same purpose, such as IGES, were developed for the Windows platform too. As a result, it's very unlikely that an IFC file was created in the same manner as an IGES or IGES-VR file. The IFC files can contain a lot of data, such as: IFC objects, such as the visualization of a project. A list of the components or subcomponents that were used in the project. A list of the materials that were used in the project. A list of the structure components that were used in the project. Information about a project.
