How AutoCAD Works The process of creating a drawing in AutoCAD is called authoring. Authoring is a design process that is broken down into many separate steps. All the different authoring steps are called drawing steps. Each drawing step is initiated by a command within AutoCAD. AutoCAD users create drawings with a combination of commands and menus. This combination of commands and menus enable the creation of drawings without the need for users to know exactly how each drawing step is created. For example, when you create an AutoCAD drawing, you create a line, add a label to the line, and then create an arc, add a text box, create a style, and add a title. A drawing step is like a recipe. Instead of writing down the ingredients needed to make a dish, the AutoCAD drawing step combination allows you to select the commands needed for that dish. Getting Started in AutoC

The Make function in AutoLISP, also known as the Macro Builder function, allows creating user-defined commands and macros. AutoCAD's native visual scripting language, VSE, introduced in AutoCAD 2013, allows creating and modifying application scripts and macros to automate the drafting process. VSE can be accessed through the command line or with AutoCAD LT. Unlike VBA and Visual LISP, which are interpreted, VSE is compiled to native C++. AutoCAD LT includes an editor similar to a spreadsheet editor for creating macros, with "Dynamic Input" and "Dynamic Output" capabilities. Additionally, a dynamic input and output tool is available in AutoCAD 2014. VBA is a dynamic high-level, object-oriented, object-based Visual Basic, programming language for Microsoft Windows. VBA macros are written in Visual Basic. Macros can be used in AutoCAD for adding custom commands to menus or toolbars, as well as within AutoCAD applications. Macros are not interpreted; they are compiled. A macro is a set of statements that, when run, perform a series of operations on the model, with respect to data stored in that model. A macro file is saved as an.accdb macro file that contains lines of macro code similar to those in VBA. Unlike VBA, a macro file can contain macros and formulas. The macro file can be run in either AutoCAD or any of the 3D applications that support macro files. Visual LISP was introduced in AutoCAD 2007. Visual LISP scripts are either compiled or interpreted. Visual LISP is available only on the Windows platform. Visual LISP scripts are saved in.lsp format and can be run in AutoCAD or any of the 3D applications that support Visual LISP scripts. Visual LISP scripts are programmed by typing into a Visual LISP graphical user interface (GUI). This allows complete control of the scripting process by the user. Visual LISP scripts can be run as macros, or as standalone scripts. Visual LISP scripts contain at least three distinct areas: a class library, a property database and a script area. The class library is used to create new classes, and provides data about the objects in the current drawing, in the property database. In addition, the property database contains information about all classes that are stored in that file and the properties of each of those classes. Finally, a ca3bfb1094
