Cited by 112 à€œ Hal the use of solar panels on.[Three independent primary intrathoracic metastases from breast cancer]. Metastasis to the thoracic region is not as common as to the systemic organs. Three women developed intrathoracic metastasis from breast cancer within a year, each suffering from advanced disease; in one of them, a thoracotomy was required for a carcinologic diagnosis. The procedure was palliative in each case, based on the possible severity of the illness. In one case, the diagnosis was not performed until the third thoracotomy, due to lack of opportunity to perform biopsies of the thoracic cavity, even though a previously performed biopsy of the breast was negative. The diagnosis was established at autopsy in the other two cases. The results in the literature suggest that not only the usual systemic dissemination of breast cancer, but also primary intrathoracic metastasis should be considered. Such a hypothesis should be evoked in women diagnosed with breast cancer and with 6d1f23a050
